## Lesson 4 - Equation of a Line

There are two ways to write the equation of a line 1) Function Form and 2) General Form.

## Function Form:

$$
\boldsymbol{y}=\boldsymbol{a} \boldsymbol{x}+\boldsymbol{b} \quad \text { where } \boldsymbol{a} \text { is the slope }
$$

$\boldsymbol{b}$ is the $y$-intercept

Ex. $\quad y=3 x+2$
slope $=3, y$-intercept $=2$

$$
y=-\frac{2}{3} x-7
$$

slope $=-\frac{2}{3}, y$-intercept $=-7$
$y=x$
slope $=1, y$-intercept $=0$

## Intercepts:

The $y$-intercept is found when $x=0$
The $x$-intercept is found when $y=0$

Ex. Find the $x$-intercept of the following line:

$$
\begin{aligned}
y & =2 x-4 \\
0 & =2 x-4 \\
4 & =2 x \\
4 & =x
\end{aligned}
$$

Graph the line using the intercepts.
$(2,0),(4,0)$

## General Form: $\quad A x+B y+C=0$

Ex. $\boldsymbol{y}=\mathbf{2 x}-\mathbf{4}$ can be written as $\mathbf{0}=\mathbf{2 x}-\boldsymbol{y}-\mathbf{4}$

Ex. Express the following equation in function form and find the slope and $y$-intercept.

$$
\begin{gathered}
3 x-2 y+5=0 \\
-2 y+5=-3 x \\
-2 y=-3 x-5 \\
y=\frac{3}{2} x+\frac{5}{2}
\end{gathered}
$$

Therefore the slope is $\frac{\mathbf{3}}{\mathbf{2}}$ and the y -intercept is $\frac{\mathbf{5}}{\mathbf{2}}$

Ex. Given $\mathrm{A}(-3,8)$ and $\mathrm{B}(6,2)$ find the equation of the line in function and general form.

Step 1: Find the slope.

$$
a=\frac{y_{2}-y_{1}}{x_{2}-x_{1}}=\frac{2-8}{6--3}=\frac{-6}{9}=-\frac{2}{3}
$$

Step 2: Find the $y$-intercept (using the slope and one of points given)

$$
\begin{gathered}
\boldsymbol{y}=\boldsymbol{a x}+\boldsymbol{b} \\
8=-\frac{2}{3}(-3)+b \\
8=2+b \\
6=b
\end{gathered}
$$

Step 3: Write in function form

$$
y=-\frac{2}{3} x+6
$$

Step 4: Convert to general form

$$
0=-\frac{2}{3} x-y+6
$$
