

Piecewise Functions

(2 or more functions on same graph)

Piecewise function:

is a function made up of two or more functions, each defined within a specific interval of the domain (ie x-value).

Ex. A car's speed between two stops is defined by the following function in which $f(x)$ is the speed in m/sec, and x is the time in secs.

$$f(x) = \begin{cases} \textcircled{1} & 2x^2 & 0 \leq x \leq 3 & [0, 3] \\ \textcircled{2} & 18 & 3 < x < 10 &]3, 10[\\ \textcircled{3} & -3x + 48 & x \geq 10 & [10, +\infty[\end{cases}$$

$y = 2x^2$

x	y
0	0
1	2
3	18

$y = -3x + 48$

x	y
16	0
10	18

$0 = -3x + 48$
 $-48 = -3x$
 $-48 = -3x \Rightarrow x = 16$

At what **times** was the car moving at 12 m/s?

A: $y = 2x^2$
 $12 = 2x^2$
 $\frac{12}{2} = \frac{2x^2}{2}$
 $\sqrt{6} = \sqrt{x^2}$
 $x = 2.45$

B: $y = -3x + 48$
 $12 = -3x + 48$
 $12 = x$

$d(A, B) = 12 - 2.45 = 9.55 \text{ sec}$

Ex. The **temperature** outdoors is tracked over the course of 10 **hours**. Describe the function over:

- 1) the first 3 hours? 2) between 3 and 6 hours 3) between 6-10 hours

$$\textcircled{1} \quad y = ax + b$$

$$\begin{matrix} (x_1, y_1) & (x_2, y_2) \\ (0, 3) & (3, 6) \end{matrix}$$

$$a = \frac{y_2 - y_1}{x_2 - x_1} = \frac{6 - 3}{3 - 0} = \frac{3}{3}$$

$$y = x + 3$$

$$\textcircled{2} \quad y = 6$$

$$\textcircled{3} \quad y = -1.5x + 15$$

$$f(x) = \begin{cases} x + 3 & [0, 3] \\ 6 &]3, 6[\\ -1.5x + 15 & [6, 10] \end{cases}$$
